machine. The spinning rotor is supported by a pair of flanged bearings which support each end of the spinning rotor. The spinning rotor is rotatable about its central axis by a drive arrangement having an input shaft which extends along the axis of rotation of the spinning rotor. The rotor is to be supported in a predetermined rotational position, e.g. an end winding position. The rotor comprises a drive input shaft part which is connected to the drive arrangement and which is supported rotatably about the central axis of the spinning machine, a drive output shaft part which extends through the central axis of the spinning machine and in which a first bearing is disposed, and a drive input shaft part which is connected to the drive arrangement and which extends along the axis of rotation of the spinning rotor and is supported rotatably about the axis of rotation of the spinning machine. The drive arrangement is provided with a first and a second shaft end and the first and the second shaft end are connected to the drive input shaft part by means a1d647c40b
